WHAT IS CLAIMED IS:

1	1. A method of making a non-replicating anti-bacterial phage, said		
2	method comprising the step of producing said anti-bacterial phage in a host production		
3	bacterium, wherein said anti-bacterial phage is unable to replicate in a target bacterium and		
4	wherein said anti-bacterial phage inhibits growth of said target bacterium.		
1	2. The method of Claim 1, wherein said non-replicating anti-bacterial		
2	phage is unable to replicate in said target bacterium because:		
3	the nucleic acid of said anti-bacterial phage is inactivated or removed;		
4	said phage comprises a mutation and cannot assemble into a replication		
5	competent phage in said target bacterium, but said host production bacterium is a		
6	complementing host bacterium that is able to complement, including with a helper phage,		
7	said mutation of said anti-bacterial phage and allow replication of said anti-bacterial phage in		
8	said complementing host production bacterium;		
9	said phage comprises DNA containing a restriction site sensitive to a		
10	restriction enzyme activity, said activity found in said target bacterium but absent in said hos		
11	production bacterium; or		
12	said phage expresses in said target bacterium a function early in		
13	infection which prevents DNA or phage replication, but fails to express said function in said		
14	host production bacterium.		
1	3. The method of Claim 2, wherein:		
2	said mutation is temperature sensitive at a non-permissive temperature,		
3	and said complementing host production bacterium complements said mutation at said non-		
4	permissive temperature;		
5	a nucleic acid of said non-replicating anti-bacterial phage comprises a		
6	mutation and cannot assemble into a replication competent phage, further comprising a step		
7	of supplying a complementing helper phage that can complement said mutation of said anti-		
8	bacterial phage and allow replication of said anti-bacterial phage in said host production		
9	bacterium;		
10	said mutation is a substantial deletion, and said complementing host		
11	production bacterium complements said deletion mutation, e.g., with a gene in said host		
12	production bacterium or a helper phage;		

said host production bacterium expresses an inhibitor of expression or
function of said restriction enzyme;
said function early in infection is a nuclease which prevents DNA or
phage replication; or
said function early in infection is blocked in said host production
bacterium by antisense message expression.
A A sharman with the control of the state of
4. A pharmaceutically acceptable complementing host production
bacterium used in a method of Claim 1.
5. A pharmaceutical composition comprising an anti-bacterial phage,
wherein said anti-bacterial phage inhibits growth of a target bacterium, and wherein said anti-
bacterial phage has diminished replication activity in said target bacterium.
6. The composition of Claim 5, wherein:
said anti-bacterial phage exhibits no DNA or phage replication activity
in said target bacterium;
said anti-bacterial phage comprises less than 98% of the complexity of
the nucleic acid of an intact phage;
said anti-bacterial phage comprises les than 20% of the nucleic acid
content of an intact parental phage;
said anti-bacterial phage comprises less than 2% of the nucleic acid
content of the intact parental phage;
said anti-bacterial phage does not contain detectable nucleic acid;
said anti-bacterial phage comprises an intact phage comprising nucleic
acid with a reduced replication capacity in said target bacterium;
said anti-bacterial phage comprises a tail portion of a tailed phage,
including a myoviridae or syphoviridae phage;
said anti-bacterial phage comprises an electron microscope
morphologically identifiable tail portion of a tailed phage;
said anti-bacterial phage consists essentially of a tail portion of a
myoviridae or syphoviridae phage;
said composition further comprises a therapeutically compatible buffer
or excipient;

21		said o	composition further comprises a second therapeutic agent,
22	including an anti-mi		antibiotic, or inflammatory agent;
23		said a	inti-bacterial phage is made by a method comprising the steps of:
24		a)	amplifying a phage in a host production bacterium,
25		b)	harvesting said phage from said host production bacterial
26	culture, and		
27		c)	depleting or inactivating substantially all of the nucleic acids
28	from said pha	ige, the	reby producing said anti-bacterial phage;
29		said a	nti-bacterial phage is made by a method comprising steps of:
30		a)	amplifying a phage in a host production bacterium, and
31		b)	harvesting said phage from said host production bacterial
32	culture before	e substa	ntial amounts of intact phage are produced or assembled, thereby
33	producing sai	d anti-l	pacterial phage; or
34	•	said a	nti-bacterial phage is made by a method comprising steps of:
35		a)	amplifying a phage in a host production bacterium, and
36		b)	harvesting said phage from said host production bacterial
37	culture, wher	ein a nu	cleic acid of said anti-bacterial phage comprises a mutation and
38	cannot assem	ble into	a replication competent phage, and wherein said host production
39	bacterium is a	compl	ementing host production bacterium that is able to complement
40	said mutation	of said	anti-bacterial phage and allow replication of said anti-bacterial
41	phage in said	comple	menting host production bacterium, including where said
42	complementing	ng resul	ts from a helper phage, thereby producing said anti-bacterial
43	phage.		
1	7.	A met	hod of treating a bacterial population:
2			bject in need of said treatment, said method comprising
3	administering a thera		lly effective amount of a composition of Claim 5; or
4			bject, said method comprising administering a prophylactically
5	effective amount of a		•
1	0	and .	
1 2	8.		ethod of Claim 7, wherein:
			acterial infection is caused by said target bacterium;
3			abject is a human;
4		said su	bject is a primate, a food, work, display, or a companion animal;

5	said target bacterium is Escherichia, Staphylococcus, Pseudomonas, or		
6	Streptococcus;		
7	said method further comprises administering a second therapeutic or		
8	antimicrobial agent, including administering systemically, parenterally, orally, topically, or		
9	by inhalation, catheter, or drain tube;		
10	said method results in a relative decrease in said population of at least		
11	10-1000 fold; or		
12	said method results in a decrease in detectability of said population by		
13	at least 5-50 fold.		
1	9. A pharmaceutical composition comprising a genetically incompetent		
2	anti-bacterial phage, wherein said anti-bacterial phage inhibits growth of a target bacterium.		
1	10. The pharmaceutical composition of Claim 9, wherein:		
2	said target bacterium is identified or diagnosed, including an		
3	Escherichia, Staphylococcus, Pseudomonas, or Streptococcus bacterium;		
4	said genetically incompetent anti-bacterial phage lacks a full		
5	complement of genetic material;		
6	said genetically incompetent anti-bacterial phage has a mutation and		
7	cannot assemble into replication competent phage in said target bacterium;		
8	said genetically incompetent anti-bacterial phage comprises nucleic		
9	acid with a reduced replication capacity, e.g., comprising a mutation, including a missense,		
10	termination, frameshift, conditional, deletion, or insertion mutation, in a critical phage		
11	replication function;		
12	said genetically incompetent anti-bacterial phage consists essentially of		
13	a tail portion from a tailed phage, including a myoviridae or syphoviridae phage; or		
14	said pharmaceutical composition further comprises an excipient,		
15	buffer, or a second therapeutic or anti-microbial agent.		
1	11. A method of using a pharmaceutical composition of Claim 9 to treat a		
2	bacterial infection in a subject in need of such treatment, said method comprising a step of		
3	administering a therapeutically effective amount of said pharmaceutical composition.		
1	12. The method of Claim 11, wherein:		
2	said subject is a human;		

3	said subject	is a primate, a food, work, display, or companion animal;
4	said pharma	ceutical composition is administered systemically,
5	parenterally, orally, topically, or b	y inhalation, catheter, or drain tube; or
6	said pharma	ceutical composition is administered in combination with a
7	second therapeutic or anti-bacteria	l agent, e.g., an anti-microbial, inflammatory, or anti-
8	inflammatory agent.	
1	13. A method o	f identifying an anti-bacterial phage that is unable to
2	replicate in a selected target bacter	rium, said method comprising the steps of:
3	culturing sa	id target bacterium; and
4	testing varie	ous potential anti-bacterial phage, including genetic variants
5	of a phage, for combined propertie	es of inhibition of growth on said target bacterium, and
6	absence of capacity to replicate pl	nage DNA or phage in said target bacterium.
1	14. An anti-bac	terial phage that is identified using said method of Claim
2	2 13, wherein said phage inhibits gr	owth of a target bacterium and is unable to replicate in said
3	target bacterium. [product by prod	ess claim, but might be difficult to enforce]
1	15. A method of	of producing non-replicating anti-bacterial phage
2	comprising the steps of:	
3	replicating	phage in a host production bacterium,
4	harvesting :	said phage from said host production bacterial culture, and
5	removing s	ubstantially all of the function of the nucleic acids from said
6	phage, thereby producing said nor	n-replicating anti-bacterial phage.
1	16. The method	1 of Claim 15, wherein:
2	said anti-ba	cterial phage is a tailed phage, including a myoviridae or
3	syphoviridae phage;	
4	said nuclei	c acids are removed by steps of:
5	sep	arating tails from heads of tailed phage fragments, and
6	5 b) isol	ating said tails;
7	said function	on of said nucleic acids is removed by steps of:
8	a) har	vesting said phage before tails and heads have assembled to
9	form an intact phage, and	
10	b) isol	ating said tails;

11	said function of said nucleic acids is removed by osmotic shock, a
12	freeze-thaw cycle, a chemical method, or a mechanical method; or
13	said function of said nucleic acids is removed by genetic mutation,
14	e.g., a missense, termination, frameshift, conditional, deletion, or insertion mutation.
1	17. A method of making a defined dose anti-bacterial phage that kills a
2	defined target bacterium, said method comprising producing said anti-bacterial phage in:
3	a host production bacterium and isolating tail portions separate from
4	DNA containing heads;
5	a host production bacterium and inactivating nucleic acid of said
6	phage, e.g., by nicking, fragmenting, crosslinking, or chemically modifying said nucleic acid;
7	a host production bacterium and harvesting components temporally
8	before substantial assembly of complete phage;
9	a complementing host production bacterium where said anti-bacterial
10	phage would not replicate in said target bacterium;
11	a host production bacterium comprising a helper phage where said
12	anti-bacterial phage would not replicate in said target bacterium; or
13	a permissive production host which phage are non-permissive for
14	replication in target bacterium in a different condition, e.g., temperature.
1	18. The method of Claim 17, wherein:
2	said anti-bacterial phage is a tailed phage, including a myoviridae or
3	syphoviridae tailed phage;
4	said anti-bacterial phage is produced in a complementing host
5	production bacterium or with a complementing helper phage, wherein the coding nucleic acid
6	for said anti-bacterial phage comprises, in a critical gene necessary for phage replication in
7	said target bacterium, a mutation, e.g., a missense, termination, frameshift, conditional,
8	deletion, or insertion;
9	said anti-bacterial phage exhibits less than 5% of the DNA or phage
10	replication activity in said target bacterium compared to that exhibited by intact phage in said
11	host production bacterium;
12	said anti-bacterial phage exhibits diminished capacity to transmit toxin
13	genes in said target bacteria when compared to intact phage in said host bacterium;

14	said anti-bacterial phage exhibits diminished immunogenicity		
15	compared to intact phage from said host bacteria upon administration to a mammal, e.g., by		
16	30%, 60%, 90%, 95%, or 99%, in immune response or number of epitopes over a period of		
17	treatment exposure;		
18	said anti-bacterial phage exhibits no significant DNA replication or		
19	phage replication activity in said target bacterium;		
20	said target bacterium is a pathogenic bacterium, including a		
21	nosocomial or pyogenic bacterium, a Gram negative bacterium, or an Escherichia,		
22	Staphylococcus, Pseudomonas, or Streptococcus bacterium;		
23	said target bacterium is a food or environmental contaminant; or		
24	a second technique is used to inactivate or remove remaining DNA in		
25	said defined dose anti-bacterial phage.		
1	19. The complementing host or helper phage of Claim 18B, wherein said		
2			
3	host production bacterium or helper phage encodes one or more genes which complement		
4	said mutation in said anti-bacterial phage, thereby allowing said anti-bacterial phage to		
7	replicate in said producing bacterium.		
1	20. A defined dose therapeutic anti-bacterial composition comprising a		
2	phage protein derived from an intact parental phage or prophage, said anti-bacterial		
3	composition capable of killing a target bacterium, said anti-bacterial composition exhibiting		
4	less than 20% DNA or phage replication activity in said target bacterium, when compared to		
5	said intact parental phage or prophage.		
1	21. The composition of Claim 20, wherein:		
2	- · · · · · · · · · · · · · · · · · · ·		
3	said composition exhibits less than 5% replication activity in said target bacterium when compared to said intact parental phage;		
4			
5	said anti-bacterial phage exhibits diminished capacity to transmit toxin		
6	genes in said target bacteria when compared to intact phage in said host bacterium;		
	said anti-bacterial composition exhibits diminished immunogenicity		
7	compared to said intact phage from a host bacteria upon administration to a mammal;		
8	said anti-bacterial phage exhibits no substantial or detectable DNA or		
9	phage replication activity in said target bacterium;		

10	said target bacterium is a pathogenic bacterium, including a		
11	nosocomial or pyogenic bacterium, or a Gram negative bacterium, such as Escherichia,		
12	Staphylococcus, Pseudomonas, or Streptococcus bacterium;		
13	said target bacterium is a food or environmental contaminant;		
14	said composition further comprises a nucleic acid with reduced		
15	replication capacity, e.g., where the nucleic acid has been nicked, fragmented, cross linked, or		
16	UV irradiated;		
17	said composition comprises less than 20% of the nucleic acid content		
18	of said intact parental phage;		
19	said composition lacks detectable nucleic acid;		
20	said composition comprises a damaged DNA that is unable to be		
21	replicated;		
22	said intact parental phage is a tailed phage, including a myoviridae or		
23	syphoviridae phage, and said composition comprises a tail portion or a tail protein;		
24	said composition further comprises a therapeutically compatible buffer		
25	or excipient;		
26	said composition further comprises a second therapeutic or anti-		
27	microbial agent, e.g., an antibiotic or a bacterial cell wall growth disrupting compound;		
28	said anti-bacterial composition is made by a method comprising the		
29	step of processing said intact parental phage to remove or inactivate nucleic acids;		
30	said anti-bacterial composition is made by a method comprising the		
31	step of harvesting phage from a host bacterium before intact phage are assembled from		
32	components thereof; or		
33	said anti-bacterial composition is made by a method comprising the		
34	step of expressing in a complementing host production strain a phage genome defective in		
35	expressing a critical gene for replication, infection, assembly, production, or release by said		
36	phage, including where said phage genome comprises a mutation, including a missense,		
37	termination, frameshift, conditional, deletion, or insertion, which prevents phage replication		
38	in said target bacterium.		
1	22. A method of treating a bacterial colonization in a eukaryote		
2	experiencing colonization by said target bacterium, said method comprising administering a		

3

composition of Claim 20 to said eukaryote.

1	23. T	he method of Claim 22, wherein:	
2	Sa	aid eukaryote is a mammal, including a primate;	
3	sa	aid eukaryote is a food, work, display, or companion animal;	
4	Sa	aid target bacterium is a pathogenic, nosocomial, or pyogenic	
5	bacterium;		
6	Sa	aid target bacterium is an Escherichia, Staphylococcus, Pseudomonas,	
7	or Streptococcus bacteri	um;	
8	Sa	aid composition is administered systemically, parenterally, orally,	
9	topically, or by inhalation, catheter, or drain tube;		
10	sa	aid colonization has already been treated with an anti-microbial or	
11	antibiotic;		
12	Sa	aid colonization has been diagnosed to be susceptible to the selected	
13	composition; or		
14	sa	aid eukaryote is also inoculated with another bacterium to replace said	
15	target bacterium.	•	
1	24. A	therapeutic anti-bacterial composition comprising a genetically	
2		rein said phage kills a target bacterium.	
_	moompotont phage who	said phage kins a target vactorium.	
1	25. T	he composition of Claim 24, wherein:	
2	. sa	uid phage lacks detectable nucleic acid;	
3	sa	aid phage comprises a chemically or physically damaged nucleic acid;	
4	sa	aid phage lacks a functional gene necessary to replicate phage DNA	
5	in said target bacterium,	or contains a gene which prevents replication of phage DNA in said	
6	target bacterium (restrict	tion/modification or phage exclusion system);	
7	sa	id phage comprises a missense, termination, frameshift, conditional,	
8	deletion, or insertion mu	tation in a gene necessary for phage replication, e.g., capacity to	
9	infect, assemble, produc	e, or release intact phage, or contains a gene whose expression	
10	prevents phage replication	on (restriction/modification system);	
11	sa	id phage comprises a tail protein from a tailed phage;	
12	sa	id composition is used therapeutically to treat a food, work, display,	
13	or companion animal, or	primate;	
14	sa	id target bacterium is a pathogenic bacterium, e.g., an Escherichia,	
15	Staphylococcus, Pseudor	monas, or Streptococcus bacterium;	

16	said composition is administered systemically, parenterally, orally,
17	topically, or by inhalation, catheter, or drain tube; or
18	said composition is administered in combination with a second
19	therapeutic agent, including an anti-bacterial, inflammatory, or anti-inflammatory agent.

68
